
Green's function of $\partial_t c = D\partial_x^2 c$
peak $\propto t^{-1/2}$, width $\propto t^{1/2}$, area constant
$t = 0.04$
$t = 0.35$
$t = 1$
$t = 2.5$
$c\sqrt{D}$
$x/\sqrt{D}$

individual walkers
each step is reversible; the spread is all
$\pm\sqrt{t}$: typical spread
displacement
time (units of $\Delta x^2/D$)

mean squared displacement
four are called 'diffusion'; only $\alpha = 1$ is Fickian
subdiffusive $\alpha = 0.6$
normal $\alpha = 1$
superdiffusive $\alpha = 1.5$
ballistic $\alpha = 2$
$\langle x^2 \rangle$
t
