stability regions
stiff λ pushes z far left: explicit dies
Im z
Re $z = \lambda\Delta t$
forward Euler (explicit)
backward Euler: whole $\mathbb{C}^-$
the Courant condition is a *stability* statement
not a resolution statement: accuracy is a separate battle
$|G|$
CFL number $U\Delta t/\Delta x$
CFL = 1
upwind, $k\Delta x = \pi$
central, $k\Delta x = \pi$
marginal
