
Two trajectories of $\dot{x} = 10(y - x)$ etc., started $\varepsilon = 10^{-6}$ apart
they trace the same butterfly,
but not at the same time
z
x
Separation grows exponentially — then saturates
reference slope: $\lambda \approx 0.91$
$|\delta|$
Lyapunov time $t_\lambda = 1/\lambda \approx 1.1$:
10^{-6} becomes $O(1)$ in ≈ 14 time units
time t
